19. (Currently amended) The computing system of claim 18,A computing system comprising:  
a housing having surfaces defining a vent aperture;  
a cooling system having a vent valve disposed adjacent to the vent aperture to adjust flow of external ambient air to cool one or more components of the computing system;  
wherein the cooling system includes a control module to determine a cooling

requirement for the computing system and to control the vent valve based on the cooling requirement;

a first set of one or more components;

a second set of one or more components, wherein if the cooling requirement indicates a need for increased cooling of the first set of one or more components, the control module is to increase airflow to the first set of one or more components and decrease airflow to the second set of one or more components, and if the cooling requirement indicates a need for increased cooling of the second set of one or more components, the control module is to decrease airflow to the first set of one or more components and increase airflow to the second set of one or more components; and

wherein the first set includes a processor die having a remote heat exchanger coupled to a heat-generating surface of the processor die.
